$$V_{LCrms} = I_{rms} \left(\omega_0 L - \frac{1}{\omega_0 C} \right) = 0$$

CHAPTER 8

8.

1 (a)
$$C = \varepsilon_0 A / d = 8.00 \text{ pF}$$

$$\frac{dQ}{dt} = C \frac{dV}{dt}$$
$$\frac{dV}{dt} = \frac{0.15}{80.1 \times 10^{-12}} = 1.87 \times 10^9 \,\mathrm{V \, s^{-1}}$$

(b) $i_d = \varepsilon_0 \frac{d}{dt} \Phi_{E_{e}}$. Now across the capacitor $\Phi_{E} = EA$, ignoring end corrections.

Therefore,
$$i_d = \varepsilon_0 A \frac{\mathrm{d} \Phi_{\rm E}}{\mathrm{d} t}$$

Now,
$$E = \frac{Q}{\varepsilon_0 A}$$
. Therefore, $\frac{dE}{dt} = \frac{i}{\varepsilon_0 A}$, which implies $i_d = i = 0.15 \text{ A}$

(c) Yes, provided by 'current' we mean the sum of conduction and displacement currents.

8.2 (a)
$$I_{\rm rms} = V_{\rm rms} \,\omega C = 6.9 \mu A$$

- (b) Yes. The derivation in Exercise 8.1(b) is true even if *i* is oscillating in time.
- (c) The formula $B = \frac{\mu_0}{2\pi} \frac{r}{R^2} i_d$

goes through even if i_d (and therefore B) oscillates in time. The formula shows they oscillate in phase. Since $i_d = i$, we have

 $B_0 = \frac{\mu_0}{2\pi} \frac{r}{R^2} i_0$, where B_0 and i_0 are the amplitudes of the oscillating magnetic field and current, respectively. $i_0 = \sqrt{2}I_{\rm ms} = 9.76 \ \mu$ A. For $r = 3 \ \text{cm}$, $R = 6 \ \text{cm}$, $B_0 = 1.63 \times 10^{-11} \text{ T}$.

- **8.3** The speed in vacuum is the same for all: $c = 3 \times 10^8$ m s⁻¹.
- **8.4 E** and **B** in *x*-*y* plane and are mutually perpendicular, 10 m.
- 8.5 Wavelength band: 40 m 25 m.
- **8.6** $10^9 \,\text{Hz}$
- 8.7 153 N/C

8.8 (a) 400 nT,
$$3.14 \times 10^8$$
 rad/s, 1.05 rad/m, 6.00 m.

- (b) $\mathbf{E} = \{ (120 \text{ N/C}) \sin[(1.05 \text{ rad/m})]x (3.14 \times 10^8 \text{ rad/s})t] \} \hat{\mathbf{j}}$ $\mathbf{B} = \{ (400 \text{ nT}) \sin[(1.05 \text{ rad/m})]x - (3.14 \times 10^8 \text{ rad/s})t] \} \hat{\mathbf{k}}$
- 8.9 Photon energy (for $\lambda = 1$ m)

$$= \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{1.6 \times 10^{-19}} eV = 1.24 \times 10^{-6} eV$$

Photon energy for other wavelengths in the figure for electromagnetic spectrum can be obtained by multiplying approximate powers of ten. Energy of a photon that a source produces indicates the spacings of the relevant energy levels of the source. For example, $\lambda = 10^{-12}$ m corresponds to photon energy = 1.24×10^{6} eV = 1.24 MeV. This indicates that nuclear energy levels (transition between which causes

Physics

 γ -ray emission) are typically spaced by 1 MeV or so. Similarly, a visible wavelength $\lambda = 5 \times 10^{-7}$ m, corresponds to photon energy = 2.5 eV. This implies that energy levels (transition between which gives visible radiation) are typically spaced by a few eV.

- 8.10 (a) $\lambda = (c/v) = 1.5 \times 10^{-2} \text{ m}$
 - (b) $B_0 = (E_0/c) = 1.6 \times 10^{-7} \text{ T}$
 - (c) Energy density in **E** field: $u_{\rm E} = (1/2)\varepsilon_0 E^2$ Energy density in **B** field: $u_{\rm B} = (1/2\mu_0)B^2$

Using
$$E = cB$$
, and $c = \frac{1}{\sqrt{\mu_0 \varepsilon_0}}$, $u_{\rm E} = u_{\rm B}$
